### Brief Description

I obtained my degree in Medical Biotechnology at the University of Rome “La Sapienza” in 2008. I performed my PhD training in “Morphogenetic and Cytology Science” at the University of Rome, La Sapienza. During this time, I extended my studies on PKC $\theta$  to its role in the pathogenesis and development of Duchenne Muscular Dystrophy (Madaro et al. 2010-2012). This discovery indicated that PKC $\theta$  could be a potential target for interventions in DMD and fuelled pre-clinical studies toward pharmacological targeting of PKC $\theta$  in DMD muscles that have been funded by a DPP-NL postdoc fellowship and are still ongoing in the laboratory of my PhD mentor, Dr Bouche’. During my PhD training I also investigated the role of ER- stress induced autophagy (Madaro et al. 2013) and I received to complete my studies (Madaro 2013, 2014). I performed my postdoctoral training in the laboratories of Dr Puri in Rome (IRCCS Fondazione Santa Lucia) and La Jolla (Sanford Prebys Burnham Medical Research Institute) with the goal of extending my expertise and background in skeletal myogenesis to the epigenetic regulation. This experience has also been fundamental to learn technologies and analytical pipelines relative to genome-wide analysis of transcriptome (RNAseq), and chromatin-binding of transcriptional factors or histone modifications (ChIPseq) (Saccone et al. 2014; Malecova et al. 2015; Malecova et al. 2018). My major achievement during my post-doctoral training has been the identification of Fibro- adipogenic progenitors (FAPs), as a novel cellular contributor of muscle atrophy in response to denervation and ALS (Madaro 2018). Based on these studies, in 2016 I received one of the most important Italian young research grant by the Italian Ministry of Health, as PI for a project focused on the transcriptional analysis of FAPs in acute denervation and ALS. In 2019 I become researcher at la Sapienza University of Rome and I received a Roche and AFM telethon research grant as a PI to study at single cell level the molecular changes in a mouse model of acuter denervation. We have recently published the first evidence regarding transcriptome alterations at the single cell level in denervated muscle (Proietti et al. 2021).
