#### Part VII – Research Activities

Keywords	Brief Description
Beyond the Standard Model of particle physics	Research activity focused on phenomenological aspects of various extensions of the Standard Model of particle physics that address—and attempt to solve—its naturalness problem. The phenomenology of these models ranges from collider physics to astroparticle signals.

Astroparticle and Cosmology	Research activity focused on dark matter physics. Understanding the nature of dark matter is one of the great mystery still unsolved in modern physics. On the particle-physics side, the research is focused on the construction of extensions of the Standard Model of particle physics that include a viable dark matter candidate. On the observational side, the research is focused on the possibility to detect dark matter via its interactions with Standard Model particles.
Formal aspects of quantum field theories with gravity	Research activity focused on the role of gravity in the context of quantum field theories. From the point of view of quantum field theory, General Relativity is an effective field theory that breaks down at the Planck scale thus requiring the formulation of a valid ultraviolet completion. In this context, the research activity is focused on the possibility to understand the properties of such ultraviolet completion with possible testable implications.
