Radical	<p><i>Properties and reactivity of radicals and radical ions.</i> Research activity focused on the investigation of the structure and reactivity of oxygen centred radicals (aminoxyl and alkoxy radicals) and radical cations of several classes of aromatic compounds (alkylaromatics, silanes, aromatic amines, sulfides and sulfoxides). The role of structural and medium effects on the generation and reactivity of these species has been analyzed by means of steady state photolysis and time resolved techniques such as laser flash photolysis and pulse radiolysis.</p>

Metalloporphyrin	<p><i>Mechanism of biomimetic oxidations.</i> In this research activity a special attention has been dedicated to the analysis of the mechanism of the oxidations catalysed by metalloporphyrin complexes as models of hemoproteins and nonheme iron and manganese complexes as biomimetic models of nonheme oxygenases. The distinction between hydrogen atom transfer and electron transfer/proton transfer mechanisms in the oxidation of hydrocarbons and direct oxygen transfer vs electron transfer/oxygen rebound mechanism in the oxidation of aromatic sulphides and sulfoxides have been investigated in detail.</p>

Nonheme Iron Catalyst	<p><i>Nonheme iron complexes for sustainable C-H oxidations.</i> Nonheme imine iron (II) complexes prepared from cheap and commercially available precursors are efficient catalysts for the oxidation of aliphatic and aromatic C–H bonds by H₂O₂. In the same research field we prepared a supramolecular catalyst based on White's iron (II) complex, which efficiently oxidizes selected methylenic positions of long primary amines due to the presence of crown ethers in the catalyst backbone that allow the substrate recognition.</p>

Lignin degradation	<p><i>Lignin degradation and photoyellowing.</i> The mechanistic aspects associated to the oxidative degradation and photoyellowing of lignin have been analyzed by using time-resolved techniques. Only a minor role is played by the ketyl pathway in the photoyellowing process while a major role would be played by the β-cleavage of α-aryloxy-substituted aromatic ketones formed by reaction of ketyl radicals with O₂ (phenacyl pathway).</p>
