Part VII – Research Activities

Keywords	Brief Description
Quantum Dots, growth, MBE, semiconductors	From 2001 to 2015 the main research activity has been related to growth and characterization (optical and morphological) especially of III-V semiconductor heterostructures. On this topic, I published more than 30 articles on high IF journals and we obtained many national/international projects.
2D materials, Graphene, fuel cells.	From 2012 I have worked actively on 2D materials characterization, especially graphene (MoS ₂ preliminary experiments have been performed), both from a fundamental and applicative point of view on fuel cells. On this topic, I have published 5 articles on very high IF journals and am responsible of a service provision contract with INUIT foundation.
Phase change materials, Memories	From 2017 I started working on characterization of phase change materials based on the pseudobinary alloy GeTe-Sb ₂ Te ₃ . We have published one article on this topic and recently won a European project (H2020).
Magnetism, semiconductors.	From 2007 to 2011 I have extensively studied the role of local interaction in III-V diluted magnetic semiconductors (mainly GaMnAs). We have set up the complex growth of these compounds and the magnetic properties were measured by Max Planck Institute in Stuttgart. On this topic, I published 7 articles on high IF journals.
Electronic properties, surfaces, semiconductors.	From 1998 to 2006 I have extensively studied electronic properties of III-V semiconductors by means of several surface sensitive techniques (HREELS, XPS, UPS, ARPES). This topic has been also the subject of my PhD thesis, we published 12 articles on high IF journals and got several projects.
Molecules aggregation, peptides, DNA	From 2009 I opened a collaboration with chemistry department in University of Rome Tor Vergata, for the study of molecules aggregation by means of Atomic Force Microscopy and X-ray Photoemission. I have published 14 articles on these topics and got several projects.
