## Research Activities

### Keywords

### Brief Description

DNA damage	<p>Our research is focused on the comprehension of the molecular mechanisms underlying the impact of the diet on genome integrity maintenance.</p> <p>The specific aims of our research deal with three main issues:</p> <ol style="list-style-type: none"> <li>1) <i>DNA damage and diabetes</i>. In particular, we are investigating the mechanisms through which hyperglycemia impairs genome integrity in different diabetic contexts by modeling different types of diabetes in flies.</li> <li>2) <i>Relationship between vitamin B6, diabetes and genome integrity</i>. More specifically, we are studying the role of vitamin B6 in chromosome integrity maintenance and in diabetes and unraveling an unanticipated relationship between vitamin B6 deficiency, levels high glucose and chromosome aberrations.</li> <li>3) <i>Role of vitamin B6 in cancer</i>. In particular we are investigating whether chromosome aberrations induced by low vitamin B6 levels can promote cancer development, using different <i>Drosophila</i> cancer models.</li> </ol> <p>Given that <i>Drosophila</i> and humans share the majority of metabolic pathways, these studies will be instrumental for the identification of some of the mechanisms through which diet can protect from chromosome instability and ultimately from cancer</p>
