Part VII – Research Activities

Keywords

Brief Description

Brain Tumors	Study of molecular and cellular mechanisms involved in brain tumors, with a particular focus on medulloblastoma and glioblastoma development and progression.
Hedgehog signaling	Identification and characterization of the molecular events involved in Hedgehog signaling regulation.
Ubiquitylation	Study of signal transduction and post-translational regulation: Role of ubiquitylation-proteolysis processes in cerebellar development and tumorigenesis.
Targeted-therapy	Identification and design of novel biomolecules for the treatment of Hedgehog-dependent tumors.
miRNAs	Identification of miRNAs as biomarkers in spinal muscular atrophy and study of their pathogenic role.

Main results attained:

1. Identification and characterization of ubiquitylation events involved in Hedgehog (HH) signaling regulation and medulloblastoma (MB) tumorigenesis: i) identification of a previously unknown oncogenic role of the aminopeptidase ERAP1 in HH-dependent tumorigenesis. ii) Identification of a new mechanism of regulation of SuFu mediated by the β -arrestin2 and the E3 ubiquitin ligase Itch complex and involved in MB oncogenesis. iii) Identification of a novel E3 ubiquitin ligase of GLI1, PCAF, able to repress HH signaling in response to DNA damage. iv) Characterization of REN^{KCTD11} function as a novel Cul3 ubiquitin E3 ligase adaptor for HDAC1 and suppressor of HH signaling.
2. Molecular mechanisms in glioblastoma tumorigenesis: identification of a novel molecular mechanism involved in glioblastoma (GB) development, mediated by the RNA-binding ubiquitin ligase MEX3A ubiquitylation and degradation of the tumor-suppressor RIG-I.
3. Study and development of new biomolecules for the treatment of HH-driven tumors. i) Identification of Glabrescione B as direct GLI1 inhibitor, able to inhibit GLI1/DNA interaction and HH-dependent tumor cell growth. ii) Design and development of the multi-targeted agent, compound 22, able to inhibit HH signaling and HH-dependent tumor growth through antagonism of both SMO and GLI1.
4. Three miRNAs have been identified as biomarkers over-expressed in the serum of patients with Spinal Muscular Atrophy (SMA).
