### Part VIII – Research Activities

Keywords

Brief Description

Interferon	Federica Frasca has experience in studying the crosstalk between viruses and the host defence signalling pathways to understand how the activation of molecular sensors of microbial pathogens, and the modulation of Interferon (IFN) response and innate immune cells could be related to clinical severity of acute, persistent, zoonotic, and arthropod-borne-viral infections. The principal viruses investigated were respiratory viruses [e.g., respiratory syncytial virus (RSV), rhinovirus (HRV) and coronavirus, including SARS-CoV-2 and surrogate models such as the feline coronavirus, (FCoVII) and the bovine coronavirus (BCoV)], human immunodeficiency virus (HIV-1), cytomegalovirus (CMV), and arboviruses such Dengue virus, West Nile Virus, USUTU virus and Chikungunya. Federica has expanded its expertise evaluating the antiviral and virucidal effectiveness of natural and synthetic antiviral molecules. The investigation on how virus-bacteria interactions affect innate immunity in immunocompromised and cystic fibrosis patients is a further scientific topic included in her research activity. Federica has developed competence on cell culture techniques, flow cytometry methods, virus propagation experiments, antiviral/virucidal assays and bioassays for the detection of anti-IFN and anti-MDA5 antibodies. She also has developed strong ability in molecular techniques as standard PCR assays for detection of viruses and Real time PCR for quantification of viral nucleic acids and gene expression measurements by Real Time PCR (qPCR).
