Telecom Italia

He currently works in Telecom Italia in the Radio Access Network Engineering sector, dealing with various issues related to the innovation and engineering of 4G and 5G mobile networks, including those related to the study of electromagnetic propagation.

In his work he deals with innovation and research. He is the scientific director of some university research collaborations between various universities and Telecom Italia.

In recent years, he has begun to deepen his work on machine learning techniques, in particular on statistical electromagnetic Big Data available in the radio access network in the context of smart cities.

An integral part of his work is the participation in European research projects, the publication of scientific research in accredited international journals. He is also the author of numerous international patents and papers.

In the past he had experience of people group coordination and Quality of service responsibility for two Italian Regions

A method of estimating traffic jams on a roads network includes receiving information from at least one cellular PLMN covering a geographic region wherein at least one road of the roads network to be monitored is located. The information includes data related to call traffic handled by the cellular PLMN in an at least one area of the geographic region, and an indication related to a mobility of mobile terminals into/out of the area. The method may further include providing an indication of traffic jam in the at least one road in case the call traffic handled by the cellular PLMN in the at least one area exceeds a first threshold and the indication related to the mobility of mobile terminals into/out of the area trespasses a second threshold.

Method for characterization of paths travelled by mobile user terminals, comprising: determining a geographical area of interest; detecting the presence of a plurality of mobile user terminals in said geographical area of interest. The method further comprises, for each of said mobile user terminals: receiving over time a plurality of information signals, each information signal including: a geographical position of said mobile user terminal, a time reference associated with said geographical position and at least one of a temporary identifier and a session identifier; based on said information signals, determining a path travelled by said mobile user terminal; calculating one or more indicators associated with said path, said one or more indicators being indicative of morphologic and dynamic features of said path; providing a characterization of said paths, based on said one or more indicators.

Earliest priority: 2015-10-30 • Earliest publication: 2017-05-04

A method of dynamically varying a power of a Reference Signal irradiated by a radio base station of a radio mobile network includes having a network entity monitoring a performance indicator associated with an area. The radio base station provides communication services to User Equipment located in a respective area served by the radio base station. The performance indicator is indicative of a communication channel state within the area. The method also includes either increasing or decreasing the power of the Reference Signal in the area based on a current value of the performance indicator. Either increasing or decreasing the power of the Reference Signal in the area based on a current value of the performance indicator includes modifying a power parameter referred to power of signals transmitted by the radio base station.
