Involvement in a National project aimed to investigate the hypothesis that statistically modeling (1) the endogenous and exogenous risk factors, (2) the presence of the amyloid and alpha-synuclein pathological aggregates in CSF, (3) the brain connectivity, and (4) the clinical and biological indices such as vigilance, general motility, the sleep-wake cycle, and genomic instability and DNA damage MAY correlate with (predict) the clinical condition of mild cognitive impairment (MCI) and dementia in patients with Alzheimer's disease (AD) and Parkinson's disease (PD). Cognitively intact healthy (Nold) participants serve to define abnormalities in the markers derived from hospital setting.
