Nella sua attività scientifica e di ricerca, il sottoscritto ha trattato problemi inversi generali e applicati nell'identificazione strutturale tramite metodi non distruttivi, come l'identificazione del danno in sistemi vibranti, l'identificazione di inclusioni in corpi elastici e la caratterizzazione di travi isospettrali e quasi-isospettrali. Su questi argomenti il sottoscritto ha sviluppato un'ampia attività sperimentale sull'uso di tecniche di analisi modale per il monitoraggio, l'identificazione strutturale e la rilevazione del danno, con applicazioni a modelli di media scala (travi, telai) e a strutture in scala reale (edifici, camini, ponti, serbatoi d'acqua). In passato, ha studiato problemi teorici per strutture sottili in elasticità lineare, dando una giustificazione di alcune teorie classiche per la determinazione del campo di stress in tubi sottili.

I suoi più recenti interessi di ricerca riguardano la modellazione di sistemi vibranti complessi, come nanotravi e ragnatele, e l'identificazione delle loro proprietà meccaniche tramite misure dinamiche non distruttive. Questo studio è sviluppato in collaborazione con gruppi di ricerca del Dipartimento di Meccanica del Continuum e Analisi Strutturale dell'Università Carlos III di Madrid, Spagna, e della Scuola Politecnica dell'Università di San Paolo, Brasile.

I risultati della sua ricerca sono stati pubblicati su importanti riviste internazionali. È autore di circa centoventi articoli pubblicati su riviste internazionali peer-reviewed, che hanno ricevuto 2.560 citazioni; l'indice h personale è pari a 29 (da Web of Science; maggio 2023).
